Why Functions as Values

- Abstraction is easier with functions as values

  - abstract over **add** and **sub** cases

  - **filter**, **map**, etc.

- What are objects? Callbacks?

- Separate **deffun** form becomes unnecessary

```

FWAE Subst

Beware: with the implementation on the previous slide,

```
(subst {with {y 10} z}
       'z
       {fun {x} {+ x y}} )
⇒ {with {y 10} {fun {x} {+ x y}}}
```

which is wrong, but we ignore this problem

- Only happens when the original program has free variables

- The problem disappears with deferred substitution, anyway

No More With

Compare the **with** and **app** implementations:

```
(define (interp a-wae)
  (type-case FWAE a-wae
    ...
    [with (bound-id named-expr body-expr)
      (interp (subst body-expr
                     bound-id
                     (interp named-expr)))]
    ...
    [app (fun-expr arg-expr)
         (local [(define fun-val (interp fun-expr))]
           (interp (subst (funV-body fun-val)
                          (funV-param fun-val)
                          (interp arg-expr))))]))
```

The **app** case does everything that **with** does

No More With

```
{with {x 10} x}
```

is the same as

```
{{fun {x} x} 10}
```

No More With

$$\texttt{\{with \{x 10\} x\}}$$

is the same as

$$\texttt{\{\{fun \{x\} x\} 10\}}$$

In general,

$$\texttt{\{with \{<id> <FWAE>}_1\texttt{\} <FWAE>}_2\texttt{\}}$$

is the same as

$$\texttt{\{\{fun \{<id>\} <FWAE>}_2\texttt{\} <FWAE>}_1\texttt{\}}$$

No More With

$$\{\texttt{with } \{\texttt{x } 10\} \texttt{ x}\}$$

is the same as

$$\{\{\texttt{fun } \{\texttt{x}\} \texttt{ x}\} \texttt{ 10}\}$$

In general,

$$\{\texttt{with } \{\texttt{<id> <FWAE>}_1\} \texttt{ <FWAE>}_2\}$$

is the same as

$$\{\{\texttt{fun } \{\texttt{<id>}\} \texttt{ <FWAE>}_2\} \texttt{ <FWAE>}_1\}$$

Let's assume

```
(test  {with {<id> <FWAE>₁} <FWAE>₂}
       (app (fun '<id> <FWAE>₂ ) <FWAE>₁ ))
```

FAE Grammar

```
<FAE> ::=  <num>

        |  {- <FAE> <FAE>}
        |  {with {<id> <FAE>} <FAE>}
