

322 Compilers Assignment: 1-test Test Cases for the L1→x86 compiler

Due Thursday, March 29th, before class

Design (at least) 25 test cases for the compiler that translates L1 expressions to assembly. For each test case, hand in two files, one called *file.L1* containing an L1 program and one called *file.res* with the expected output (note that each call to `print` produces one line of output).

Each test case must produce some valid output from the interpreter (on the course web page).

Hand in your assignment by sending email with the subject `1-test` to `robby@eeecs.northwestern.edu`. The email should include an attachment named `name.1-test.tar.gz`. The `name` should be your last name in all lowercase letters unless you are pair programming, in which case it should be both last names in alphabetical order, separated by `+`. For example, if Robert Jordan and Brandon Sanderson were pair programming and handing in this assignment, they'd send in a tarfile named `jordan+sanderson.1-test.tar.gz`.

The attachment must contain a single directory named `1-test` containing the test cases.

See the lecture notes for the precise description of L1.

The primary goal of this assignment is to familiarize you with L1. That said, I will also run your test cases in all of the L1 compilers (mine and yours) and if the test cases uncover bugs, you will get credit for that (see the course web page for details of how grading works).
