Welcome!

Simone Campanoni
simone.campanoni@northwestern.edu
The CAT team

All of us have office hours to answer your questions throughout the quarter

Simone Campanoni
Atmn Patel (TA)
Riley Sophia Boksenbaum (PM)

Syllabus: CAT syllabus.pdf
Lectures and files: Lectures
Tutorials: link
Piazza: piazza
Zoom:
  - lectures
  - Simone's office hours
  - Atmn's office hours
  - Sophia's office hours: MG51
What we are going to do

• Teach you **code analysis and transformation**

• What they do
• What they could do

• What they can’t do
Who you are

• An engineer

• A C++ developer
  (you don’t have to be an incredible coder)

• An enthusiastic learner

Compiler expert is not mentioned ;}
You know how to write C++ code in Linux platforms (e.g., class, inheritance, method overloading, containers like a set) 
C++ tutorial: http://www.cplusplus.com/doc/tutorial/

You know Makefile 
Makefile tutorial: http://www.cs.colby.edu/maxwell/courses/tutorials/maketutor

You know how to debug C++ code 
gdb tutorial: https://www.tutorialspoint.com/gnu_debugger/index.htm
Machines to use for this class

You have access to the following machines, which are used to test your homework

• Wilkinson lab
  gotham.ece.northwestern.edu, batman.ece.northwestern.edu, robin.ece.northwestern.edu, alfred.ece.northwestern.edu, gordon.ece.northwestern.edu, madhatter.ece.northwestern.edu, joker.ece.northwestern.edu, cobblepott.ece.northwestern.edu, bane.ece.northwestern.edu, nightwing.ece.northwestern.edu, selina.ece.northwestern.edu, ras.ece.northwestern.edu, poisonivy.ece.northwestern.edu, freeze.ece.northwestern.edu, scarecrow.ece.northwestern.edu, clayface.ece.northwestern.edu, harley.ece.northwestern.edu, killercroc.ece.northwestern.edu, huntress.ece.northwestern.edu, batgirl.ece.northwestern.edu, riddler.ece.northwestern.edu, hush.ece.northwestern.edu

• WOT systems
  murphy.wot.ece.northwestern.edu, finagle.wot.ece.northwestern.edu, hanlon.wot.ece.northwestern.edu, moore.wot.ece.northwestern.edu
Outline of today’s CAT

• Structure of the course

• CAT and compilers

• CAT and computer architecture

• CAT and programming language
CS 323 CAT in a nutshell

- About: understanding and transforming code automatically
- Tuesday/Thursday 5pm – 6:20pm

- Atmn’s office hours: Wednesday 1pm – 3pm via Zoom Starting next week
- Sophia’s office hours: Thursday 2pm – 4pm in MG51 Starting this week
- Simone’s office hours: Monday 5pm – 6pm via Zoom Starting next week

- CAT is on Canvas
  - Materials/Assignments/Grades on Canvas
  - You’ll upload your assignments on Canvas
CAT materials

- Modern compiler implementation
- Slides and assigned papers
- LLVM documentation

http://llvm.org
CAT slides

• You can find last year slides from the class website

• We improve slides every year
  • based on problems we will observe during the next 10 weeks
  • as well as your feedbacks we will ask you at the end
  • Our goal: maximize how much you learn in 10 weeks

• We will upload to Canvas the new version of the slides just before each class

• Slides support my teaching philosophy
The spirit of my lectures
a.k.a. my teaching philosophy

• I’ll describe problems/opportunities

• I’ll describe concepts required to solve these problems (take advantage of these opportunities)

• I’ll describe their solutions that are based on these concepts

Problems/opportunities/concepts are structured in weeks

• I’ll describe new problems/opportunities

• You’ll apply concepts/solutions learned during my lectures to solve the new problems/opportunities
  • Required to pass the homework
The CAT structure

Week

1st day

2nd day

Homework

Topic & homework

Today

12/8
The CAT grading

• Homework: 100 points
  • 10 points per assignment
  • The first assignment is easy

• Extra points
  • Extra homework
  • Answering (correctly) special questions (I will emphasize them) during lectures
  • Best student so far: 114 points!

<table>

The CAT competition

• At the end, there will be a competition between your CATs

• The team that designed the best CATs
  • Get an A automatically (no matter how many points they have)
  • Their names go to the “hall of fame” of this class
Rules for homework

• You are encouraged (but not required) to work in pairs
  • Pair programming is *not* team programming
  • **Declare your pair by the next lecture (via email to TA)**
    After a pair is formed, you can only split
    (no new pairs will be allowed; also, pairs cannot merge)

• No copying of code is allowed between pairs

• Tool, infrastructure help is allowed
  • First try it on your own
    (Google and tool documentation are your friends)

• Avoid plagiarism
  [www.northwestern.edu/provost/policies/academic-integrity/how-to-avoid-plagiarism.html](http://www.northwestern.edu/provost/policies/academic-integrity/how-to-avoid-plagiarism.html)

• If you don’t know, please ask: simone.campanoni@northwestern.edu
Summary

• My duties
  • Teach you code analysis and transformation
  • And how to implement them in a production compiler (LLVM)

• Your duties
  • Learn code analysis and transformation
  • Implement a few of them in LLVM
    • Write code
    • Test your code
    • Then, think **much harder** about how to **actually** test your code
    • (Sometimes) Answer my questions about your code

No final exam
Structure & flexibility

• CAT is structured w/ topics

• Best way to learn is to be excited about a topic

• Interested in something?

  Speak

  I’ll do my best to include your topic on the fly
Today
• Welcome/Structure
• Compiler/CAT

Next lecture
LLVM
Outline of today’s CAT

• Structure of the course

• CAT and compilers

• CAT and computer architecture

• CAT and programming language
The role of compilers

If there is no coffee, if I still have work to do,
I’ll keep working, I’ll go to the coffee shop.

Will I go to the coffee shop when I have coffee?

Code analysis and transformation
Example of CAT

```python
varX = 5
...
...
...
...
print varX
...
```

What will it print?
Example of CAT

```python
varX = 5
...
print varX
...
print 5
...
```
Example of CAT

\[
\text{varX} = 5
\]

\[
\ldots
\]

\[
\ldots
\]

\[
\ldots
\]

\[
\text{print 5}
\]

\[
\ldots
\]

\[
\text{Transformed code}
\]

\[
\text{Properties of the code}
\]

\[
\text{Analysis}
\]

\[
\text{Code}
\]
Designing CATs

• Choose a goal
  • Performance, energy, identifying bugs, discovering code properties, ...

• Design automatic code analyses to obtain the required information

• Occasionally design code transformations
Use of CATs

• Compilers
  • Increase performance
  • Decrease energy consumption
  • Decrease code size
  • Drive the code translation

• Developing tools (e.g., VIM, EMACS)
  • Understanding code (e.g., scopes, variables)
  • Generate suggestions

• Computer architecture
Structure of a compiler

Structure of a compiler
Multiple IRs

• Abstract Syntax Tree

• Register-based representation (three-address code)
  \[ R1 = R2 + R3 \]

• Stack-based representation
  ```
  push 5; push 3; add; pop;
  ```

IR needs to be easy
1) to produce
2) to translate into machine code
3) to transform/optimize
Example of LLVM IR

define i32 @main(i32 %argc, i8** %argv) {
  entry:
    %add = add i32 %argc, 1
    ret i32 %add
}

CATs that we’ll focus on

• Semantics-preserving transformations
  • Correctness guaranteed

• Goal: performance

• Automatic

• Efficient
Outline of today’s CAT

• Structure of the course

• CAT and compilers

• CAT and computer architecture

• CAT and programming language
Evolution of CATs (hardware point of view)

- Simple hardware (few resources), simple CATs
Evolution of CATs (hardware point of view)

- Simple hardware (few resources), simple CATs
Evolution of CATs (hardware point of view)

- Simple hardware (few resources), simple CATs
Evolution of CATs (hardware point of view)

- Simple hardware (few resources), simple CATs
- More hardware resources available to compilers
- Opportunities to improve programs
- Challenging CATs

Compilers/CATs are considered in the processor-design stage!
Evolution of CATs (hardware point of view) (3)

Very long instruction word (VLIW)

Inst 1 Inst 4 Inst 7 Inst 8

Inst 2 Inst 5 Inst 3 Inst 6
Outline of today’s CAT

• Structure of the course
• CAT and compilers
• CAT and computer architecture
• CAT and programming language
Evolution of CATs (PL point of view)

• First electronic computers appeared in the ’40s
• They were programmed in machine language

00101010111001010101001010101011010

• Low level operations only
  • Move data from one location to another
  • Add the contexts of two registers
  • Compare two values

• Programming: slow, tedious, and error prone
Evolution of CATs (PL point of view)

• Low level programming language, simple CATs
  • Not very productive

• More abstraction in programming language, more work for CATs to reduce their performance overhead
  • Macros -> Fortran, Cobol, Lisp -> C, C++, Java, C#, Python, PHP, SQL, ...

• CATs enable new programming languages
Evolution of CATs (PL point of view)

• Abstractions are great for productivity

• CATs remove their overhead

• But abstractions must be carefully evaluated considering CATs

• A simple abstraction in PL can generate challenges for CATs
  • CATs need to be understood
Evolution of CATs (PL point of view)(2)

PL without procedures

```c
void main (){  
    int v1,v2;  
    v1 = 1;  
    v2 = 2;  
    ...  
}
```
Evolution of CATs (PL point of view)(3)

Let’s add procedures to our PL

```c
void myProc (int *a, int *b){...}
myProc(&myVar1, &myVar2);
```
Evolution of CATs (PL point of view) (2)

```c
void myProc (int *v1, int *v2){
    (*v1) = 1;
    (*v2) = 2;
}
```

What’s the problem for CATs?  ... if v1 and v2 alias ...

Understanding if pointers alias: pointer alias analysis

This is one of the most challenging problem in CATs
Conclusion

• CATs used for multiple goals
  • Enable PLs
  • Enable hardware features

• CATs are effected by
  • Their input language
  • The target hardware

• When you design a PL or a new hardware platform, you need to understand what CATs can and can’t do
  • Often: a can’t becomes can thanks to research on CATs
Ideal CATs

• Proved to be correct

• Improve performance of many important programs

• Minor compilation time

• Negligible implementation efforts
Code transformations

• Conventional transformations: they preserve the original program semantics
  • These are the transformations that are included in commodity compilers (e.g., gcc, clang, icc)

• In this class, we only consider this type of code transformations
Code transformation

**Code transformation:**
An algorithm that takes code as input and it generates new code as output

Semantically-preserving code transformation:
A code transformation that *always* generates code that is *guaranteed* to have the *same semantics* of the code given as input.

**What is the program semantics?**
Program semantic

Program semantic: Input -> Output
Two programs, p1 and p2, are semantically equivalent if for a given input, p1 and p2 generate the same output for every possible input

```
int main (int argc, char *argv[])
{
    int x = argc;
    int y = x + 1;
y++;
    printf("%d", x + y);
    return 0;
}
```

```
int main (int argc, char *argv[])
{
    int y = argc + 2;
    printf("%d", argc + y);
    return 0;
}
```

```
int main (int argc, char *argv[])
{
    int y = argc + 2;
    printf("%d", 2*argc + 3);
    return 0;
}
```
Program semantic

**Program semantic:** Input -> Output

Two programs, $p_1$ and $p_2$, are semantically equivalent if for a given input, $p_1$ and $p_2$ generate the same output for every possible input.

```c
int main (  
    int argc, char *argv[]  
){
    int y = argc + 2;
    printf("%d", 2*argc + 2);
    return 0;
}
```

```c
int main (  
    int argc, char *argv[]  
){
    int y = argc + 2;
    printf("%d", 2*argc + 2);
    return 1;
}
```

```
$ ./myprog 2
6
$ echo $?
63
```
Program semantic

Program semantic: Input -> Output

Two programs, p1 and p2, are semantically equivalent if for a given input, p1 and p2 generate the same output for every possible input.

```
int main (int argc, char *argv[])
{
    int y = 42;
    return y;
}
```

```
int main (int argc, char *argv[])
{
    int y = 42;
    return 42;
}
```

We have preserved the semantics of the original code!
Program semantic

Program semantic: Input -> Output
Two programs, p1 and p2, are semantically equivalent if
for a given input, p1 and p2 generate the same output
for every possible input.

```
int main (int argc, char *argv[])
{
  int y = 42;
  int x = y;
  if (argc > 20)
    y = 81;
  return x + y;
}
```

Our new code transformation

```
int main (int argc, char *argv[])
{
  int y = 42;
  int x = y;
  if (argc > 20)
    y = 81;
  return x + y;
}
```

Our transformation needs to understand how the execution flows through the instructions to preserve the semantics!

```
int main (int argc, char *argv[])
{
  int y = 42;
  int x = 42;
  if (argc > 20)
    y = 81;
  return x + 42;
}
```

This is ok!

When this is executed

We haven’t preserved the semantics of the original code
As Linus Torvalds says ...

*Talk is cheap. Show me the code.*

Demo time
Always have faith in your ability

Success will come your way eventually

Best of luck!
